Project Group Number: 73

Tutorial Group: 06

Assigned TAs: Nidhi Jha, Mann Khatri

Project Scope:

Skillr is an integrated database-based solution that integrates freelancers and businesses. Most fundamentally, the project will help establish a safe and open marketplace where clients are able to offshore projects by posting detailed project job requirements with specified base budgets, and Freelancers are able to demonstrate their competencies through professional portfolios through Advanced payments and Bidirectional Ratings. The platform performs the role of an intermediary of the demand of digital labor and the provision of specialized skills.

1. Job Posting

Client (as an organization or individual) promotes the digital services through placing a Job. During posting, the client will be required to give a project title, a description of the project, categories of skills required and a Minimum Base Price with job category (Web Dev, Design, Content) in order to provide an opportunity to analyze labor trends to a specific extent.

2. Registration & Verification

To provide services through the portal, freelancers need to create an account in which they provide personal information, their professional competence, a portfolio, and competence skills. In order to secure the integrity of the platform, they should post a government-accepted identification paper or professional certificate. The clients are also enrolling with their organization information.

3. Negotiation & Appointment

Registered Freelancers place Bids (Proposals) once a job has been advertised. A freelancer decides which job to take and input his/ her proposed rate and plan of time. The system enables a bilateral Negotiation between the client and the freelancer to agree on bulk rates or project cost. When a contract is achieved, the system verifies the availability of freelancers and sends a Contract (Appointment). DB needs to change the job status to be open to hiring.

4. Advance Payments

The financial transactions are handled in a multi-stage process by the system:

Advance: When entering into the contract, a client pays a certain amount in the form of a fixed percentage (Advance).

Status of work: The system enrolls either an achievement of milestones by a freelancer pursuant to his work schedule. In case of non-delivery of a freelancer within the deadline (or no-show), the contract is marked as re-negotiable or can be cancelled.

Final Settlement: The balance amount is paid at the end of the job. Each data on cost and payments made on procurement can be audited.

5. Analysis & Eligibility Logic

The system identifies the Experience Level of the freelancer according to his or her experience and puts him or her as a Junior, Intermediate or Senior. Freelancers of "Senior" category only may choose the high-budget projects on the level of Enterprise. One who has been blacklisted (according to history of dispute) cannot offer a bid.

6. Inventory & Monitoring

The Platform Admin follows the work Inventory to observe the number of jobs filled and the number of professionals covered in particular spheres of skills on daily basis.

7. Ratings

On the end of the contract, the system will require a 2-way Rating (1-5 stars) and the qualitative review between the Client and Freelancer. These scores are automatically aggregated by the database to update a rating of a user. This score can be described as a quality-filter, in which users who reach a certain score are forbidden to place or place a job, and only people who perform well will be active on the site.

Users:

1. Admin: Approves Registrations, Resolves Disputes, Monitors Audits
2. Freelancer: Submits Proposals, Updates Milestones, Manages Portfolio
3. Client: Posts Jobs, Evaluates Bids, Funds Contracts

Entities:
